

Ideation Phase

Empathize & Discover

Empathy Map Canvas

Date	12 June 2026	Team ID	N/A (Solo Project)
Project Name	Network Anomaly Detection	Maximum Marks	2 Marks

THINK & FEEL <i>What really counts Major preoccupations Worries & aspirations</i> • Anxious about missing a real threat hidden in hundreds of daily alerts • Worried that a security breach on their watch could damage the organization's reputation • Preoccupied with staying ahead of zero-day threats that signature-based tools miss • Aspires to be seen as a proactive security leader, not just someone who reacts to incidents • Frustrated that current tools don't learn what "normal" traffic looks like		
HEAR <i>What friends/boss/influencers say</i> • Management: "We need better threat visibility and faster incident response" • Colleagues: "The alert system cries wolf — we've started ignoring it" • Industry reports warn of rising ransomware and supply-chain attacks • Vendors promising AI-powered security with little evidence or transparency • Auditors: "We need documented, auditable incident response workflows"	Network Admin / Security Analyst	SEE <i>Environment Friends Market offerings</i> • Dashboards overflowing with raw traffic logs and rule-based alert noise • Colleagues overwhelmed by manual triage — spending hours on false positives • Competitors and peers adopting ML-based threat detection tools • News of major data breaches and ransomware attacks at similar organizations • Market offers many tools but few that adapt dynamically to their specific network
SAY & DO <i>Attitude in public Appearance Behaviour towards others</i> • Says: "We need a smarter system — one that actually learns what normal looks like" • Says: "I spend more time triaging alerts than investigating real threats" • Manually reviews network logs and dashboards for hours each day • Constantly tweaks alert thresholds on rule-based systems to reduce noise • Writes detailed incident reports after every significant anomaly or security event • Attends cybersecurity briefings and shares threat intelligence with the team		

PAIN <i>Fears Frustrations Obstacles</i> • Alert fatigue — too many low-quality alerts make it hard to spot real threats • Slow detection: security incidents often discovered hours or days after entry • No behavioral baseline — tools cannot distinguish normal from abnormal traffic	GAIN <i>"Wants" / Needs Measures of success</i> • Real-time anomaly detection with severity scores — alerts that actually matter • AI that learns the network's normal behavior and adapts automatically over time • Fewer false positives — a 60%+ reduction in manual monitoring effort
---	---

- Siloed security tools that don't share context or communicate with each other
- Fear of missing a critical breach due to limited time for manual investigation

- Clear visual dashboards to communicate threats easily to management
- Confidence that threats are identified and contained before becoming full breaches
