

Project Development Phase

Model Performance Test — Data Analytics

Date: 29 June 2026

Team ID: N/A

Project Name: Network Anomaly Detection

Maximum Marks: 10 Marks

Model Performance Testing:

S.No.	Parameter	Screenshot / Values
1.	Dashboard design No of Visualizations / Graphs —	NOT APPLICABLE — see note below. Closest mapping: the project's results dashboard (anomaly_dashboard.png, Milestone 7) contains 4 panels: Anomaly Score Distribution, Confusion Matrix, Detection Rate by Attack Type, and Model Performance Metrics. However this is a static Matplotlib/Seaborn figure, not an interactive BI-tool dashboard.
2.	Data Responsiveness	NOT APPLICABLE This parameter refers to interactive BI dashboard responsiveness (e.g. live filters, drill-downs). The project uses static Python visualizations.
3.	Amount of Data to Rendered (DB2 Metrics)	NOT APPLICABLE DB2 Metrics apply to IBM Db2 / IBM Cognos deployments. The project uses CSV files stored on Google Drive, not a DB2 database.
4.	Utilization of Data Filters	NOT APPLICABLE Interactive data filters are a BI-tool feature. The project's visualizations are generated programmatically in Python and are not interactive.
5.	Effective User Story No of Scene Added —	NOT APPLICABLE "Scenes" in this context refers to IBM Cognos story slides / scene pages.

S.No.	Parameter	Screenshot / Values
		The project does not use Cognos or any scene-based storytelling tool.
6.	Descriptive Reports No of Visualizations / Graphs —	NOT APPLICABLE Closest mapping: the EDA visualizations (eda_visualizations.png, Milestone 3) contain 6 panels: Traffic Label Distribution, Normal vs Attack Ratio pie chart, Flow Duration Distribution, Packet Length Mean Distribution, Top-10 Correlated Features bar chart, and Flow Bytes/s boxplot. Again, these are static Python figures, not BI-tool reports.

Note: This template is designed for projects built on Business Intelligence / dashboard tools (IBM Cognos, Power BI, Tableau, etc.). The Network Anomaly Detection project is a machine-learning pipeline implemented in Python / Google Colab. Its visualizations are static Matplotlib/Seaborn figures produced in code, not interactive BI dashboards. All applicable metrics are captured in the Machine Learning and Cyber Security (VAPT) templates.
